

Your filter is wrong in both directions

An FDIC-insured bank

LINKEDIN SAYS

Construction

An SEC-registered wealth manager

LINKEDIN SAYS

Semiconductor Mfg.

A New Jersey school district

LINKEDIN SAYS

Luxury Goods & Jewelry

It **misses** real fits. And it **pulls junk**: a plain Banking + United States filter returned 16,895 companies, about 10,500 of them not banks.

Coverage = share of each public registry found. Filters = every fitting LinkedIn industry label. Runs of 2026-09-27; the SEC figure counts matches across the whole data stack. Source: Growth Engine X, perfect-company-list.

Pull wide. Judge every row.

1 Learn
which labels your real customers use

2 Pull
every one of them, wide on purpose

3 Judge
one yes/no question per company, on a cheap model: **900K+ judgments ≈ \$12**

4 Loop
find lookalikes of the fits, judge them the same way

5 Stop
when 20 runs in a row add one company or fewer

Judge model in the demos: Jev (TypeSafe AI). Source: Growth Engine X, perfect-company-list.

You write the question

ASK	Is this a bank or savings institution that takes deposits?
YES	A deposit-taking bank or thrift
NO	Credit union, mortgage lender, fintech, broker, wealth manager, bank software vendor, association

The edge cases get decided **in the criteria**, before the model sees a single row.

Example judge question, adapted from Growth Engine X, perfect-company-list.

What's your coverage rate?

Run your list against a registry before you trust the filter.

Eric Nowoslawski, Growth Engine X. The full talk is at Sculpt, Oct 8, San Francisco.

Hosted by **Andreas Wernicke** (Clay Club NY) with **Munnawar Hashim**, **Siya Verma** and **Shriya Nevatia** (Clay).
