

The integration bill that grows on its own

CORES

The size of the servers running the platform

Climbs when volume forces bigger hardware

CONNECTORS

Each SAP or Salesforce adapter can be its own line item

Climbs when another system gets plugged in

TRANSACTIONS

Messages moved between systems

Climbs when the business simply does more

ENVIRONMENTS

Dev, test and production each licensed

Climbs when one flow needs three copies

Which phases does AI actually shorten?

AI-ASSISTED			PARTLY	HUMAN-LED
1	Discovery and inventory	tooling drafts a gap-analysis report	PARTLY	
2	Business-rule validation	process owners confirm what old flows really do		HUMAN-LED
3	Code conversion	reads legacy exports, writes API spec + new code	AI-ASSISTED	
4	Testing	IBM positions Flow Pilot to help test	PARTLY	
5	Security and compliance review	sign-off stays with people		HUMAN-LED
6	Parallel run + partner re-certification	both platforms live; EDI partners re-test		HUMAN-LED
7	Decommission the legacy platform	the date the old license can actually end		HUMAN-LED

"Multiple years to under six months," per Miracle's page. Does that clock stop at row 3, or row 7?

Every pitch has a destination

Each script is sold by someone who owns the destination.

What does the TCO slide count?

Total cost of ownership: everything paid over a system's life, sorted by when each cost lands.

ON THE SLIDE License retired → cloud bill added

OFTEN OFF THE SLIDE

DURING MIGRATION Re-platforming labor · flows nobody knew existed

PARALLEL RUN Two bills at once · partner and EDI re-certification

AFTER CUTOVER Monitoring + on-call · data egress fees · per-call pricing at high volume

NEXT RENEWAL Lock-in that may move to a cloud provider · the incumbent's retention discount (cuts the other way)

Maruti Kampli, Miracle Software Systems · Tue Sept 15, 11am ET · online

Framework from pre-event research, not Miracle's model.
