

5 arguments worth keeping from a pitch- heavy night

Daytona AI Builders · with Oracle & Datadog · NYC,
June 2026

The signal, stripped of the sell.

The agent gets its own computer

VM		Container	Sand box
Boot speed	Slow	Fast	Fast
Iso level	Strong	Shared kernel	High
State	Persist-ent	Some	Snap shot
Dispos-able	No	Partly	Yes

None of the old three fit. So a new one is forming.

`</>` ARGUMENT 2

A receipt, not a green check

Write Code

Boot PR Sandbox

Drive Real App

Attach Video Receipt

"All tests pass" means nothing when the agent wrote the test.

Evals are a measurement problem

Concept

Systematize 

Don't outsource this to AI

Operationalize

Signal

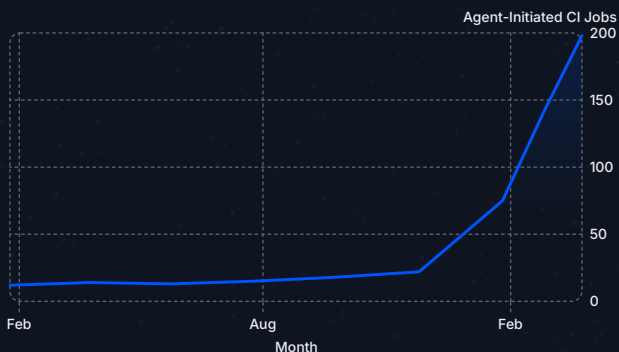

Eval

Interrogate: Eval loops back to Concept — the cycle never ends.

ARGUMENT 4

A model release, visible in infrastructure

Dec 2025 — Claude Opus 4.5 · ~11× vs. September

Source: Blacksmith customer data (self-reported — directional)

Pilot → production is an integration problem

The demo

Prompt

Agent

One box. Clean.
Simple.

Production

VCN · Load balancers · Private endpoints ·
Data plane · Identity · Governance · Secrets
mgmt · Audit logs · Rate limiting · WAF ·
DNS · TLS termination · Service mesh ·
Policy engine · Observability · SIEM ·
Change control · Compliance

The gap is **integration**, not the model.

Which of these is true in your stack? 🙋
