THE UPCOMING WEEK · OCT 26–30

Six rooms, five days, one double-booked Wednesday

Source: event listings (Luma, Meetup) and invites, 2026.

Six rooms, six open questions

ROOM	WHAT GETS CHECKED	THE OPEN QUESTION
AWS NYC	a model before release	“Can Bedrock use a judge from outside its own catalog?”
The Shortlist	the hire	“Which seats are open now, and where are they based?”
DatologyAI	the training data	“What does a buyer pay for: tokens curated, compute saved, or a seat?”
Daytona	what the agent carries	“When forked runs are scored, is the grader inside the sandbox or outside it?”
Agents in NYC	the judge	“What human-agreement rate made a no-explanation judge shippable?”
Frontier Build	the merge	“Can a reviewer agent satisfy branch protection, and on which paths never?”

Two numbers, two different measurements

6x

less compute

WHAT IT MEASURES

Models trained on Studio-curated public datasets matched the largest baseline.

Baseline: Datology's own 39-dataset public mix, scaled to 10T tokens.

launch post, 2026-10-09

under 20%

of training compute

WHAT IT MEASURES

The Thomson Reuters segment, matching the strongest public data baselines.

Baseline and compute method: not public.

webinar invite

Both are Datology's own figures, measured differently. The TR baseline isn't public yet.

Who owns the eval tools now

Source: SiliconANGLE (2026-03-09); Dynatrace press release (2026-08-13); GovConWire / 01net (Oct 2026); Datadog blog (2026-09-24); AWS Bedrock docs (fetched 2026-10-24).

What would settle it, room by room

AWS NYC	a named baseline next to cost-per-correct-answer.
The Shortlist	a named owner for each open seat.
DatologyAI	a billing unit, or a third party reproducing a multiplier.
Daytona	a vendor stating where its own product stops.
Agents in NYC	a latency or cost-per-task number, and a take count for the robot.
Frontier Build	one class of change no agent may merge.
