DAYTONA AI BUILDERS · NYC · OCT 28

What does a long-running agent carry?

KEYS
runtime

KEYS
pipeline

04 CUSTOMER MEMORY ACROSS CHANNELS

03 WORLD MODEL OF PRODUCTION

02 PER-AGENT MEMORY

01 MACHINE STATE

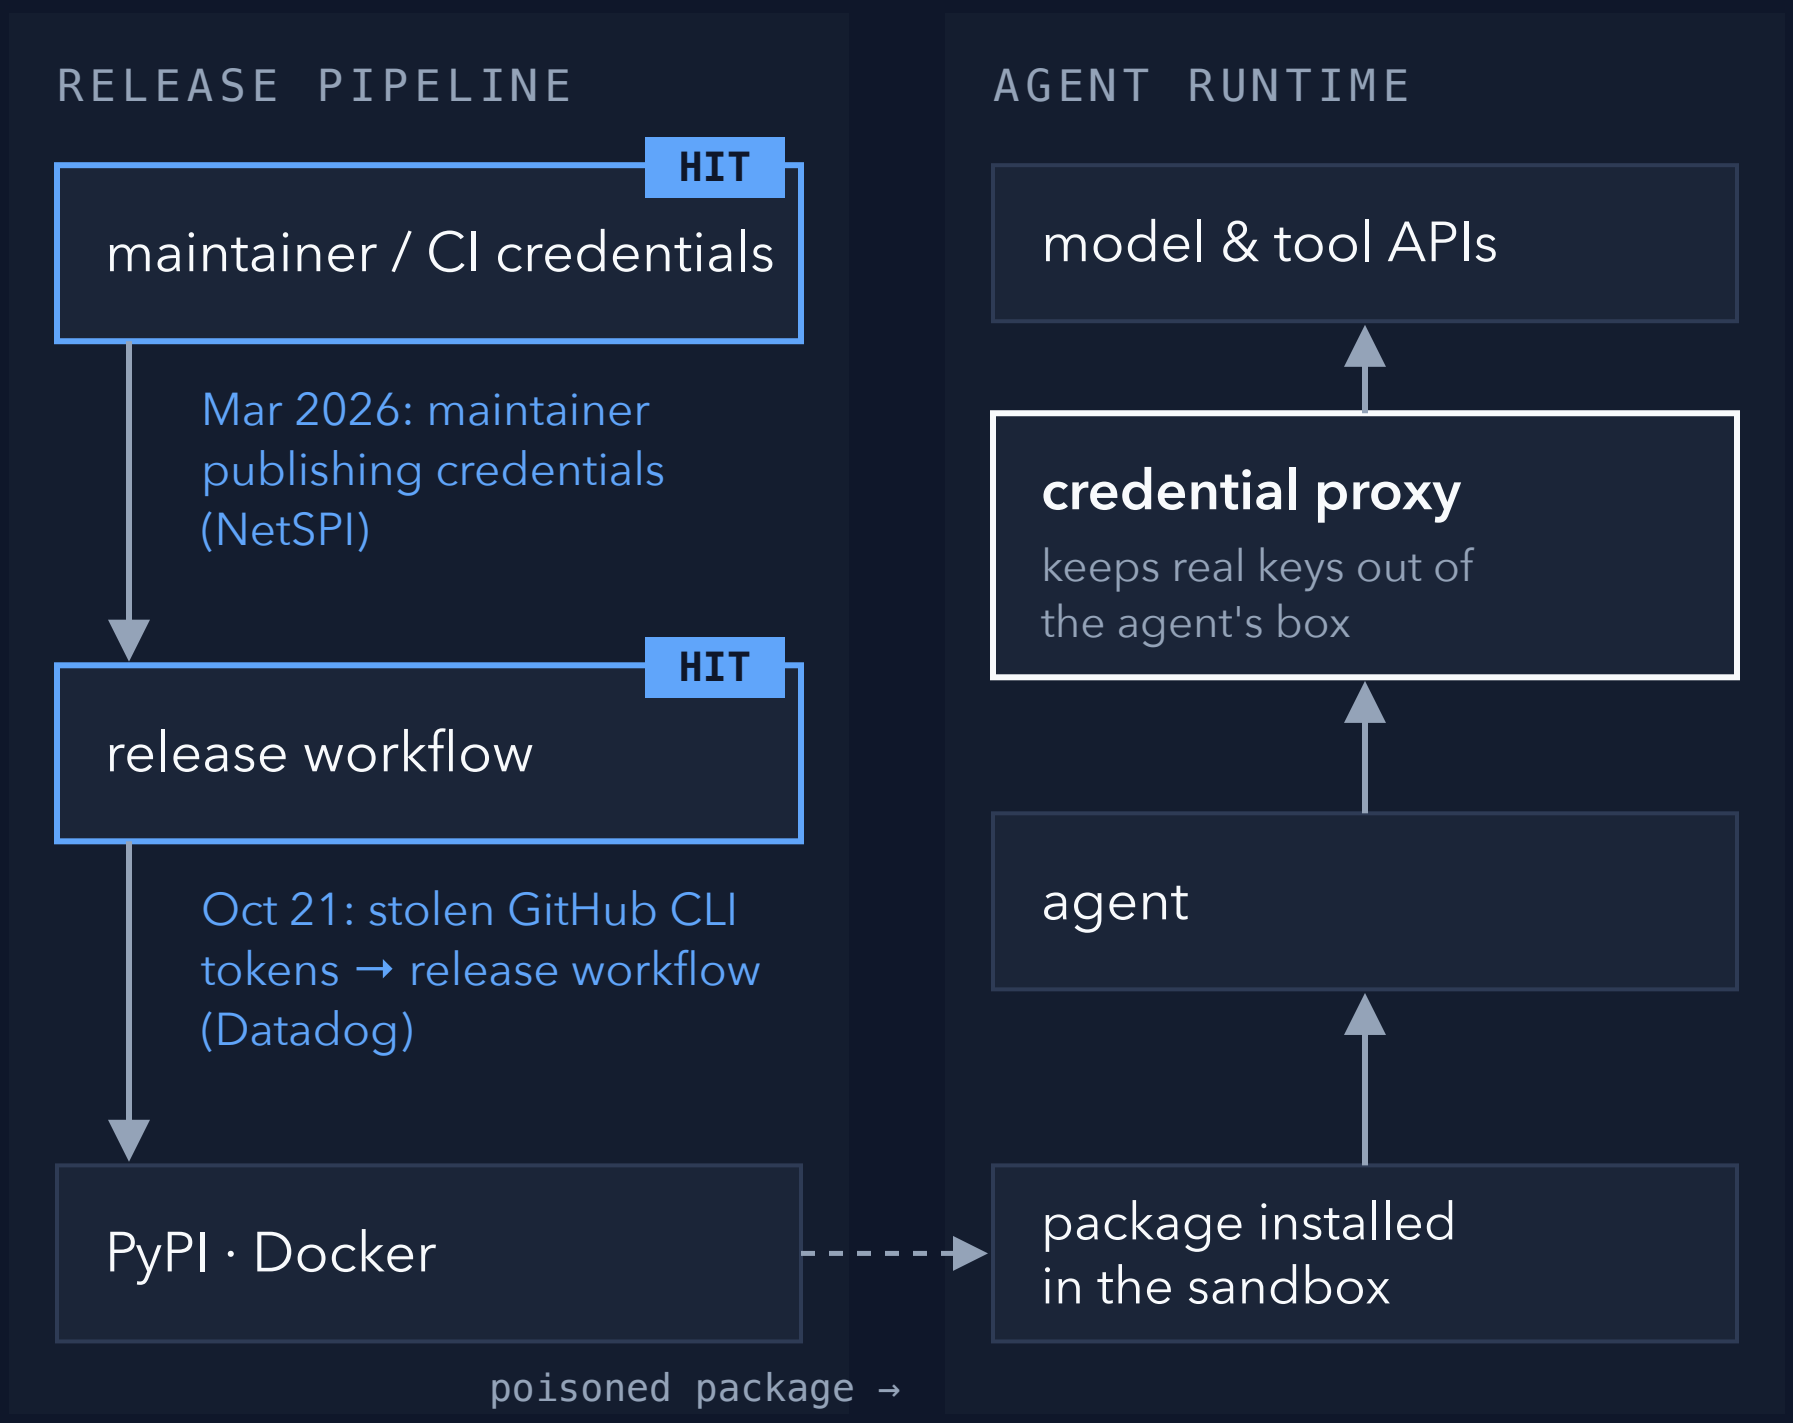

Layers: talk agenda, Daytona AI Builders NYC (Luma), 2026

Every layer has a seller, and a limit

SOLD AS	STATED LIMIT ▌ (SOLID) OR OPEN QUESTION ⬚ (DASHED)
MACHINE STATE **Daytona sandboxes**	Docs: fork works on VM sandboxes only
PER-AGENT MEMORY **AWS AgentCore Memory**	OPEN: who settles contradictions across 10 memories?
WORLD MODEL **Antimetal**	OPEN: Jan layers ≠ Oct layers. Rename?
CUSTOMER MEMORY **Twilio Conversation Memory (GA May 6)**	Twilio's own build post: a new customer has no context until a first conversation closes
KEYS **Infisical Agent Vault · Daytona Secrets Manager**	Infisical: Agent Vault doesn't address data sent out via an allowed API

Sources: Daytona docs (Sandboxes), 2026 · Antimetal blog, Jan 2026 · Twilio changelog, May 2026, and Twilio blog (Obert, Conversations + eve build), Oct 8 2026 · Infisical blog, Apr 2026 · talk abstracts, Luma, 2026

The keys are two layers

October details still moving. No link between the two established (Datadog).

Sources: Datadog Security Labs, 2026-10-21 · NetSPI, 2026-03-24 · Infisical docs (Agent Vault), 2026

Who owns it in production?

One tick per row. Then: who gets paged?
