

Before: the database sat under the app

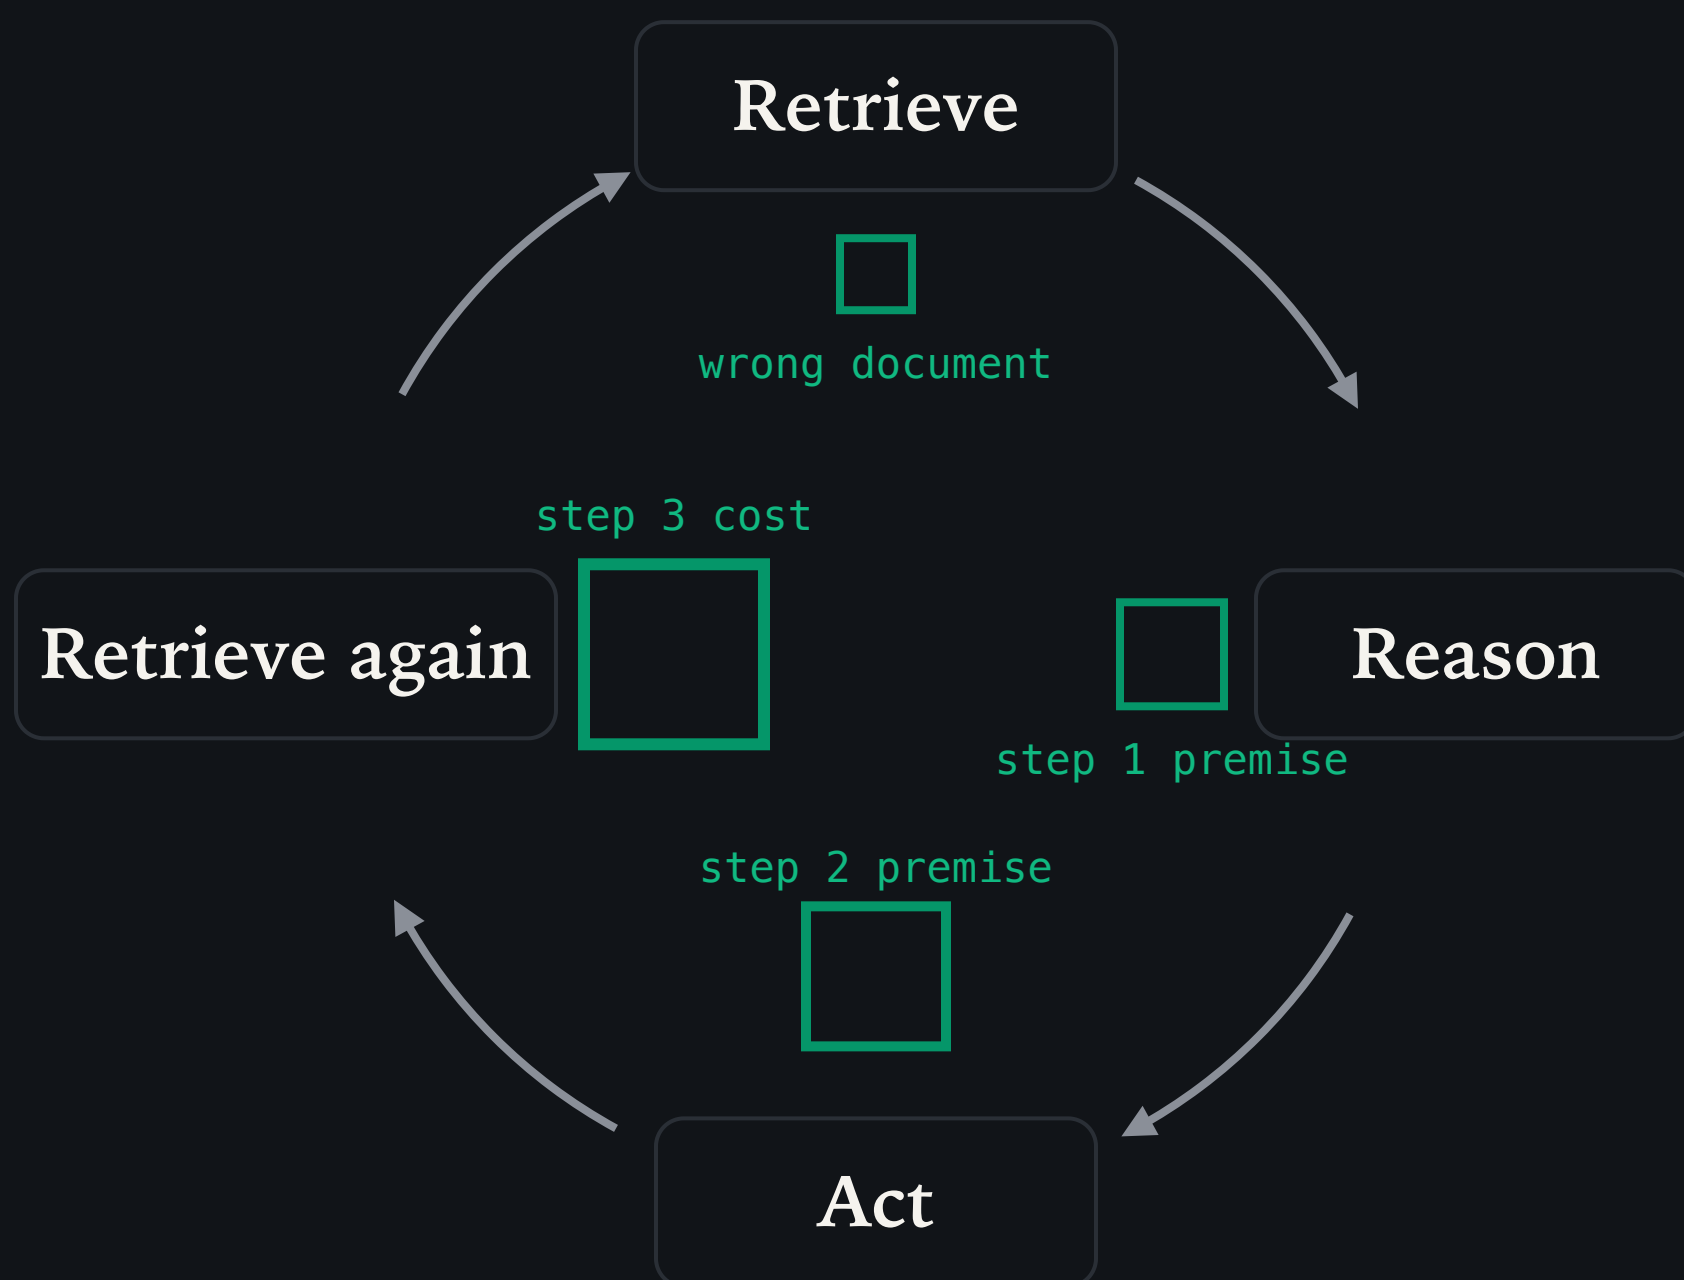

After: the data layer claims four jobs

Source: MongoDB.local NYC agenda, 2026

What changed: one bad result compounds

Inaccuracy: the most commonly cited AI risk (McKinsey, 2026)

Source: McKinsey, State of AI Trust 2026; session framing from MongoDB.local NYC agenda ("The Cost of Getting Retrieval Wrong")

Easier to trust, or harder to move?

ONE DATA PLATFORM

- fewer integrations
- one place to set access rules
- memory next to the operational data

BEST-OF-BREED

- dedicated memory services (Mem0, Zep, Letta)
- Postgres now stores JSON and vectors too
- swap a layer without migrating the rest

Which layers will buyers pay a database vendor for?
