Who decides the caller is done?

NYC Voice Agent Hackathon ·
Take2 AI × Reach Capital · Fri Nov 6

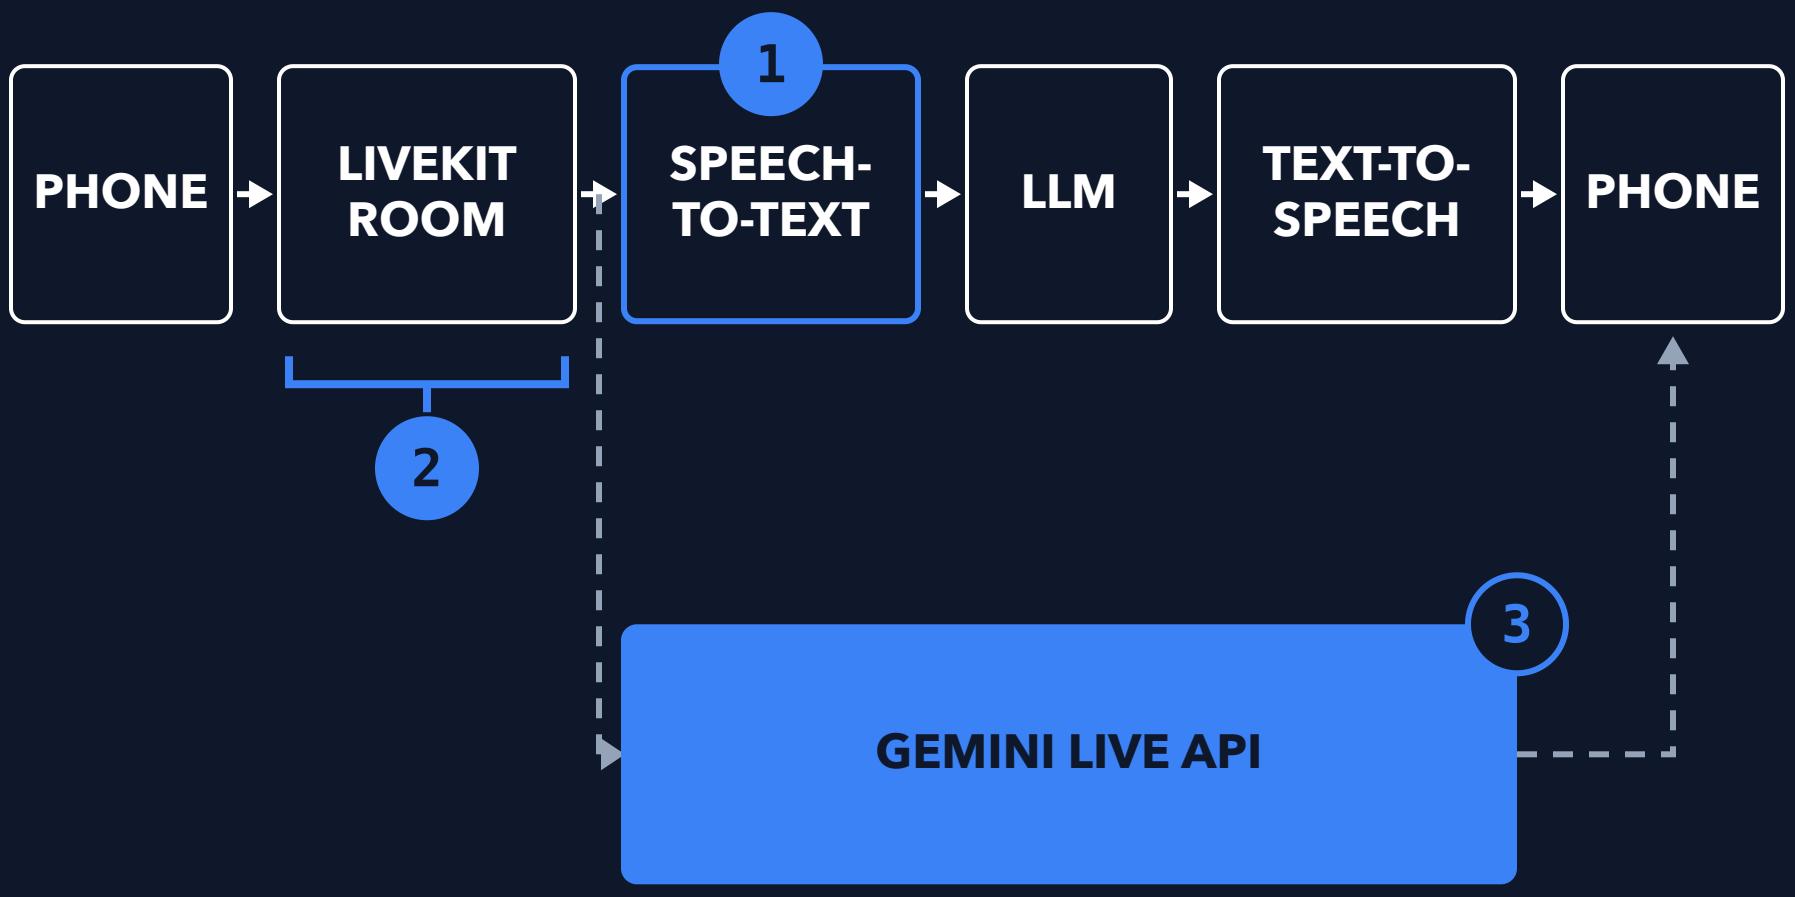

Five ways a caller breaks an agent

JUDGED: INTERRUPTIONS · SILENCE · CURVEBALLS

THE CALLER…	A PASS LOOKS LIKE
Barges in mid read-back: ‘no wait, Tuesday’	Stops talking, updates the slot, doesn’t repeat what was cut
‘Mm-hm’, a cough, a door slam	Keeps talking, or resumes
Pauses to think: ‘I’d like to book… um…’	Doesn’t cut in
8–10 seconds of dead air	Reprompts, varies the second one, then ends politely
‘Are you a robot? Can I talk to a human?’	Answers honestly, redirects once, offers a handoff or ends

Criteria: event invite, Take2 AI × Reach Capital, 2026. Test rows: Alex’s own pre-build test plan.

Three places to put one decision

1. **In the transcriber:** Deepgram Flux end-of-turn
2. **In the framework:** LiveKit turn detector + adaptive interruption
3. **In the model:** Gemini Live API hears and speaks

> Pick one owner. Two can step on each other.

Every speed knob has a price

DEEPGRAM FLUX EOT_THRESHOLD

← Faster, more cut-offs

Fewer cut-offs, slower →

Can raise LLM calls

50–70%

if you add eager end-of-turn (starts the LLM before the caller is surely done)

> Vendor-documented. Friday's test: a live phone call.

Source: Deepgram Flux docs (vendor), 2026.

Where would you put the turn?

Transcriber · framework · model. Friday, NYC.

Shipped one on real calls? Tell me what broke first.
