AGENTS IN PRODUCTION · ROOM REPORT · OCT 12

Two stacks. One rulebook.

A database company and a production-ops company took the same stage and wrote the same three rules for agent state.

Alex Yedi

WHERE AGENT STATE LIVES

Opposite ends of the stack

Model vendor

Workflow engine

Runtime

Database

SURREALDB · TOBIE MORGAN HITCHCOCK

One shared memory every agent reads, scoped by its token

Ops agent

ANTIMETAL · SHREYAS IYER

A world model of production that agents read and write back to

HOW EACH BUILT THE SAME RULE

Same three rules, built twice

	SURREALDB · MEMORY	ANTIMETAL · WORLD MODEL
Outside the agent	One store under every agent. A fact HR learns, Finance can recall.	One model of the system. Agents load it, then write back what they learn.
Retired, not deleted	Old facts superseded, still answerable. Decay ranks what surfaces.	Graph snapshots over time. A vanished service gets a confidence, not a delete.
Provenance travels	Every recall names the conversation, the agent and when.	Every wiki page shows where its facts came from and how they update.

RUN MORE THAN TWO AGENTS? YOU HAVE ALL THREE

Each rule kills one failure

DIVERGENCE

Two answers, both cited

Nothing says which is current

→

ONE WRITE

Every reader sees it

No sync step, no second ingest path

HANDOFF AMNESIA

The summary is the leak

What missed it is gone

→

INGEST EVERYTHING

Every turn stored

The store extracts, not the agent

NO PROVENANCE

A fact from nowhere

No source, no date, no audit

→

CITE ON RECALL

Source travels with it

Which conversation, which agent, when

Source: SurrealDB deck, "What breaks" + "The contract," Oct 12 2026

It resumes days later.

What is it still allowed to do?

Shared memory has a rulebook now. Permissions on resume don't.
